

# **Pascal's paradox**

From: Dr. Pragya Mishra

# Pascal's paradox

- Pressure depends only on the elevation and the type of the fluid; NOT on the size of the fluid container
- All containers have the same pressure at the bottom!!
  - referred to as the Pascal's Paradox

FIGURE 3.7 Illustration of Pascal's paradox.

# The role of elevation also comes into play with respect to pressure in a water distribution system

FIGURE 3.8 Use of a water tower or a standpipe to maintain water system pressure.

The Supply point should be higher than the receiving points to allow pressure to be maintained by gravity.

# Manometers

- Instrument to measure pressure.
- Simplest kind – U tube manometer
- One end – open to the atmosphere
- Other end – connected to the fluid whose pressure is to be measured
- Contains liquid (gage fluid)– whose deflection indicates the pressure
- Gage liquid – should not mix with the other liquid

- Procedure for measurement:
- Start from the point which is exposed to atmosphere, and move towards the point at which the pressure is desired.
- If you move down in the fluid, pressure increases; and vice versa.

Problem : Compute the pressure at A?

**FIGURE 3.10** U-tube manometer.

- $\gamma_m = 9.81 \times 13.54 = 132.8 \text{ kN/m}^3$
- $P_1 = 0$
- $P_2 = 0.25 \times 132.8 = 33.2 \text{ kN/m}^2$
- $P_3 = P_2 = 33.2 \text{ kN/m}^2$
- $P_4 = P_3 - 0.4 \times 9.81 = P_3 - 3.92 = 29.28 \text{ kN/m}^2$
- Answer =  $P_a = 29.28 \text{ kN/m}^2 = 29.28 \text{ kPa}$

Problem :

Determine the difference in pressure between points A and B

Specific wt of water = 62.4 lb/ft<sup>3</sup>.

**FIGURE 3.11** Differential manometer.

*pt.*

*pt 2*

*pt.*

*1*

- $P_1 = P_a + 33.75 \times \gamma_o$
- $P_1 = P_2$
- $P_3 = P_1 - 29.5 \times \gamma_w$
- $P_4 = P_3 - 4.25 \times \gamma_o$
- $P_b = P_4 = P_a + 33.75 \times \gamma_o - 29.5 \times \gamma_w - 4.25 \times \gamma_o$
- Or
- $P_b - P_a = 33.75 \times \gamma_o - 29.5 \times \gamma_w - 4.25 \times \gamma_o$
- $= 29.5 \gamma_o - 29.5 \times \gamma_w$
- $= 29.5(\gamma_o - \gamma_w)$
- $\gamma_o = 0.86 \times 62.4 = 53.7 \text{ lb/ft}^3$
- $P_b - P_a = 29.5 \text{ in} \times (53.7 - 62.4) \text{ lb/ft}^3$
- $= 29.5 \text{ in} \times (-8.7 \text{ lb/ft}^3) \times (1 \text{ ft}^3 / 1728 \text{ in}^3)$
- Answer :  **$P_b - P_a = -0.15 \text{ lb/in}^2$**

# Other types of manometers

## Well-type manometer

**FIGURE 3.12** Well-type manometer. (Source of photo: Dwyer Instruments, Inc., Michigan City, IN)

(a)

(b)

# Inclined well-type manometer

# Barometers

- Device for measuring atmospheric pressure.
- Filled with mercury
- Mercury filled tube is inverted in mercury bath. Mercury column drops a little – filled with mercury vapor at 0.17 Pa.
- The height of the mercury provides the atmospheric pressure

$$0 + \gamma_m h = P_{\text{atm}}$$

$$P_{\text{atm}} = \gamma_m h$$

- Mercury depth decreases 1.0 inch every 1000 ft of increase in altitude. (pressure will decrease as you go up in the atmosphere).
- Specific wt of mercury changes with temp! So adjustments with temp have to be made!

# Pressure gages and transducers

Gage - Pressure sensed mechanically.

Pressure transducer – pressure measured at one point, displayed at another – pressure sensed mechanically and converted into an electrical signal.

# Problems

- **Q.** A pressure gage at 19.0 ft from bottom of tank reads =13.19 psi. Another at 14 ft, reads = 15.12 psi. Compute – specific wt, density, and specific gravity of fluid in tank.

**Soln.** We have two known pressure points and the distance between them!

$$p_2 - p_1 = -\gamma(z_2 - z_1)$$

$$(15.12 - 13.19) * 144 = \gamma * (19.0 - 14.0)$$

Therefore  $\gamma = 55.6 \text{ lb/ft}^3$

Remember  $\gamma = \rho g$

Therefore,  $\rho = 55.6 / 32.2 = 1.73 \text{ slug/ft}^3$

$$SG = \gamma_f / \gamma_w = 55.6 / 62.4 = 0.891.$$

**Q.**A reservoir of CCl<sub>4</sub> has mass of 500 kg and a volume of 0.315m<sup>3</sup>. Find the weight, density, specific weight and specific gravity.

**Soln.**  $m = 500 \text{ kg}$  ,  $g = 9.81 \text{ m/s}^2$

$$W = mg = 500 * 9.81 = 4905 \text{ N} = 4.905 \text{ kN}$$

$$\text{Density} = \rho = m/V = 500/0.315 = 1587 \text{ kg/m}^3$$

$$\text{Specific wt} = \gamma = W/V = 4.905/0.315 = 15.57 \text{ kN/m}^3$$

$$\text{SG} = 15.57/9.81 = 1.59$$
